EFS Technology showcases

Automating Processing of Multi-drop PODs

AutoFORM PDM automatically separates scanned multi-drop manifests into web ready—individual—proof of delivery notes.

2nd October 2008

The third annual Courier and Parcel Logistics (CPL) exhibition and conference, held on 30 September, 1 and 2 October 2008 at the ExCeL London exhibition and conference centre, was hailed as an enormous success by visitors and exhibitors alike. Though still young, the show is already regarded as the leading event dedicated to the fast-growing global express and parcel delivery services sector. This year 4000 visitors from 85 countries visited CPL's 100 exhibitors.

EFS Technology showcased a new POD document management innovation for multi-drop couriers. Developed in conjunction with one of the world's largest courier companies, the AutoFORM POD Multi-drop solution automatically separates scanned multi-drop manifests into individual proof of delivery notes, and converts them into images that can be linked to the courier's web-based parcel tracking systems. The company had originally considered portable PDAs, but previous experience had shown that they were very expensive, easily lost and broken. Furthermore, many of their contracting customers insisted on the legal security of a handwritten signature than an electronic one. The AutoFORM solution provided a cost effective alternative whilst retaining the use of tried and trusted paper documents.

Benefits

The benefits are a reduction in debtor days, cost reductions and improved protection of commercially sensitive data. Payback is typically achieved within 3 months. More importantly is the SLA target improvement: the automated AutoFORM system makes POD copies available online within 24 hours of delivery compared to 7 days with the paper system.
